

Zach Marble

Final Summary

What Strength Did I Bring To The Team?

The strength I brought to the team was organization and planning. I felt like I had a large role in getting our team into the project after we plotted out how we wanted to approach the problem. I also felt like I played a role in a lot of the pair coding “backseat coder” role where I would watch for mistakes and give input as we all tried to keep track of the never ending list of pointers.

What Am I Most Proud Of?

The thing I am most proud of is the amount of things our group tried, despite them being new concepts in our project. The different data structures and the migrate functions are especially highlights because of the struggle they gave us and the satisfaction of them finally working.

What Would I Do Differently?

I would start the project with less bells and whistles. I think we all could conceptualize the project in its entirety but we don’t fully understand exactly how everything fits together when we implement each piece. The enumeration was a perfect example of this. None of us were aware that we were creating a circular dependency, but it happened because we were doing too many things. If we were to start with the bare minimum and test and implement later on we would’ve avoided many different issues.
